Detail Description Paragraph - DETX (30):
[0059] FIG. 5 (View Average of C1 Processing Web Configuration) shows a slightly more complicated configuration, in which we see two processor objects with update pins, a Waveform Averager 520 and a Trace Renderer 530. In this scenario, the configuration is idle until either Waveform Averager 520 or the Trace Renderer 530 are updated via their update pins 524, 534, respectively. When Waveform Averager 520 is updated, it will request results from Acquisition Board's 510 C1 output 516 and will accumulate and normalize those results to produce a new output result 526. When Trace Renderer 530 is updated, it will request results from Waveform Averager's 520 output 526 and will process those results by building a displayable image. If Trace Renderer 530 is updated again before Waveform Averager 520 has been updated, then it will simply get the same result from the Waveform Averager's output. In this case, Trace Renderer would not have any processing work to perform unless some aspect of its definition had changed such that it were necessary to re-process the same data (e.g. graphical window-size changed and displayable representation was not re-scalable). Thus, proper synchronization of the various update pins and data transfer sequences is essential, especially if it is desired to run various processor objects at different clock speeds, as will be discussed below.
